Title

A Measure of Fun. Extending the scope of web usability.

Abstract

Currently usability research and practice are facing a challenge. The focus of design concerns is expanding from predominantly functional aspects of IT systems to overall user experience, which has direct implications for the area of usability evaluation. When the focus is on experiences rather than on more functional aspects of systems, a revision of usability methods is required. The aim of the study reported in this thesis is to explore the potential of traditional usability evaluation approaches to deal with issues related to user experience, such as fun and entertainment.

The empirical study reported in the thesis deals with *fun and entertainment*, employs concepts and methods of *web usability*, and specifically focuses on the so-called *entertainment web sites (EWSs)*. Existing studies in the area of usability evaluation are examined to determine to which extent these studies can shed light on evaluation of fun and usability. It is concluded that evaluation of fun and usability remains an open issue. Then apparently the most relevant theories of fun and usability are analyzed to establish if these theories can help *operationalize* fun and entertainment as aspects of web usability. Since the input from theories is judged as not specific enough to guide a revision of usability evaluation methodology, the study defines fun and entertainment relevant for usability evaluation as properties intentionally implemented by designers. In the study, traditional usability evaluation methods are applied on EWSs and based on these results the methods are revised. Finally, these revised methods are used in evaluations of EWSs once more.

The results of the study indicate that traditional usability evaluation methods can be applied to evaluation of entertainment and fun in the context of web usability. More specifically, existing empirical evaluation and heuristic evaluation methods are found to produce relevant and potentially useful evidence when applied to evaluation of entertainment web sites. Therefore, the main conclusion of the thesis can be formulated as follows; while the underlying concepts and principles of web usability can be employed in evaluation of entertainment and fun, specific evaluation methods need to be revised. The results reported from this study must be seen as a step towards development of appropriate methodology for assessing user experience.

Keywords: Usability, web usability, usability evaluation methods, inspection methods, empirical usability evaluation methods, funology, entertainment web sites, HCI.

When looking back on the process of writing a Ph.D Thesis one come to realize the true nature of collaborative work. Even if such a process sometimes is lonely, that it not how I will remember my writing process of this thesis. To all the people, mainly at the Department of Informatics, who have spent endless hours discussing topics related to usability and fun with me during these years – thank you!

Viktor Kaptelinin has been my supervisor, mentor and support throughout the whole process of writing the thesis. We sometimes had truly different opinions and strong arguments – often with constructive results though. You have had to handle so much – frustration, tears, anger, irony and tight time-schedules in reviewing of articles. At so many times you turned my blurry grey thoughts to clear black and white dichotomies. I will always remember your most commonly used phrasing whenever I came up with my ideas; ‘There are actually three issues here.. number one... number two.. and finally, and perhaps most important, number three...’ You were always there, whenever I needed you and I cannot thank you enough! Erik Stolterman, my second supervisor, I would like to acknowledge for giving me support in the most difficult passages of the process of the thesis, and for broadening my horizons in my research. You are always a source of inspiration.

Kalle Jegers is another important person to acknowledge in this context. With a true interest in HCI and usability you have always been there for discussions. We have shared many hours in evaluations throughout our projects and you have never complained on high workload or tight schedules. Thank you also for your work with the formatting of the thesis. It is a true joy to work together with you.

Another person to acknowledge is Maria Nordmark – perhaps the most passionate person for usability related issues there is to be found. We met during my collaboration with Paregos at a project meeting in Skellefteå and we immediately connected. We have shared so many interesting discussions about all our collaboration projects throughout the years. Maria – you cannot fully understand how much your support meant to me in times of regrets and frustration. Your phone calls are always a source of inspiration.

So many people have been practically involved and contributed in so many ways. I have so many people to thank – now I am starting to feel like I am giving a speech at the Oscar’s, which I am not – but there are so many people to mention. First of all, I would like to acknowledge the experts for their efforts in the expert evaluation. To protect your identity I do not mention you by name, but you all know who you are. Your contribution to the results of thesis was very important. Johan Tufberg, Claes Tojkander and Karin Danielsson, thank you for endless hours collaborating with me in the empirical usability evaluations. I would like to give special thanks to the panel at the pre-seminar for your efforts and valuable input – John Waterworth, Ulrika Westergren, Ulf Hedestig, Carl-Johan Orre and Kalle Jegers. If this would have been the Oscar’s the time-limit guy would now wave furiously, but fortunately it isn’t.

People outside informatics to be acknowledged are the staff at Paregos Mediadesign AB. Throughout our collaboration we have had our share of disbelieves and different worldviews, but overall it has been a great trip! If I had a chance to choose I would do it all over again. Special thanks to Maria Bergmark, Eva Ringström, Niklas Forslund, David Eriksson, Marlene Eriksson and Henrik Aspén. I would like to give special thanks to Ellenor Lindgren for design of the layout of the thesis.

Marie Wiberg, Ph. D. student in Statistics at Umeå University, gave valuable input and help in everything related to statistics in the thesis. I have a slight feeling I am repeating myself when saying this, but I know you believe me when I say it – I could NOT have done it without you.

Pat Shrimpton, Department of Modern Languages, who did the proofreading of the thesis – thank you for spending endless hours reading and sharing your knowledge.

On a personal level I would like to thank my parents. You have always supported me, whatever I have come up with in life – and this was no exception. You are truly the best parents one could wish for!

Finally, Mikael – without you, what is the point?

Charlotte Wiberg
